Ankit Gupta

Full Stack Developer — Angular · .NET Core · PostgreSQL

Vapi, Gujarat | +91 9016517823 | ankitjgupta2002@gmail.com

SUMMARY

Full Stack Developer with 3+ years of end-to-end product ownership — requirements, architecture, development, deployment, and production support. Built a configuration-driven workflow and form automation platform that replaced weeks of developer effort with hours of admin configuration, serving multiple enterprise clients across PostgreSQL and SQL Server. Works primarily in Angular and .NET Core; hands-on with Docker, CI/CD, Redis, and RabbitMQ.

TECHNICAL SKILLS

Frontend: Angular (v6–v21), TypeScript, RxJS, Angular Material, Bootstrap, Tailwind, SCSS

Backend: .NET Core (C#), RESTful APIs, JWT Auth, ASP.NET Middleware

Database: PostgreSQL, SQL Server, Stored Procedures, Views, Triggers, DB Design & Indexing

DevOps & Tools: Docker, IIS, CI/CD, Git, Redis, RabbitMQ, Postman, Swagger, SendGrid

WORK EXPERIENCE

Full Stack Developer — Setu Net Pvt Ltd **May 2023 – Present**

Vapi, Gujarat

- Handles the full product lifecycle for internal platforms — gathering requirements, developing features, deploying to both IIS (Windows) and Ubuntu (Linux) servers, and providing production support.
- Architected and built a configuration-driven workflow platform (.NET Core, Angular) that automated the majority of internal operations; admins define approval chains, escalation rules, form routing, role-based access, and email notifications entirely from the UI — with zero code changes or redeployments per workflow.
- Built a visual Form Builder with step-by-step setup (list → mail → escalation → review → form) that auto-generates database tables, registers views, wires workflow routes, creates sidebar menu entries, and grants role access in a single transaction — reducing new module setup from weeks of developer effort to under 2 hours for a non-technical admin.
- Over time, shifted from feature-focused development to a more dynamic, performance-driven approach — including optimising a role-privilege query from 8.4 s to 80 ms and building dual-database support (PostgreSQL and SQL Server) from a single codebase.
- Built a reusable Angular component library — covering dynamic forms, modals, and dashboards — now used as the standard across the company's internal products.
- Writes and optimizes stored procedures, views, and triggers in SQL Server, and is currently leading the migration of the production schema to PostgreSQL. Also manages the full API lifecycle, from design and testing in Postman/Swagger through documentation and deployment.

EDUCATION

B.Sc. Computer Science — SSR College, Silvasa **2020 – 2023**

GPA: 8.80 (A+)

PERSONAL PROJECTS & LEARNING

JobPing — Job Alert Platform for Developers **2026 · In Development**

- Designed and built independently — 20-table PostgreSQL schema, .NET Core 8 REST API, and Angular 18 frontend. Used Redis for caching and rate limiting, RabbitMQ for async alert delivery, Docker Compose for six-service local setup, and GitHub Actions for CI/CD.

Currently studying: TypeScript (advanced), Angular internals, RxJS patterns, PostgreSQL optimisation, system design, DSA (daily practice), and AI integration.
